

Dr. Marion R. Bryson

	Inducted October 5, 1998
	Technical Director, Systems Analysis Group, U.S. Army Combat Developments Command, Fort Belvoir, Virginia, 1968-1972
	Senior Scientist and Scientific Advisor, Combat Developments Experimentation Command, Fort Ord, California, 1972-1983
	Director, Combat Developments Experimentation Command, Fort Ord, California; renamed TEXCOM Experimentation Center; and moved to Fort Hunter Liggett, California, 1983-1991
	Technical Director, Headquarters, Test and Experimentation Command, Fort Hood, Texas, 1991-1994

Dr. Marion Bryson was a major contributor to Army operational testing for over 25 years. As a scientific advisor, director, and technical director of major Army operational organizations, he left a lasting imprint on how the Army of today and of the future will conduct operational and force development tests and experiments.

Dr. Bryson was extremely influential in the realization that the experimental battlefield was a joint military-scientific creation - an enterprise blending military experience with scientific method. He consistently espoused that battlefield realism was the province of the experienced soldier and that the soldier and scientist must meet on a middle ground of technology.

He was the scientist in the foxhole and tank turret, with the soldiers, using a clipboard and stopwatch to record data, but always with a vision to the future of data collection. It was under his direction that CDEC quickly evolved into the Army's premier highly sophisticated electronic field laboratory at Fort Hunter Liggett.

When CDEC was reorganized and re-designated as a center in 1983, Dr. Bryson was appointed as the first civilian director, a position he held for nine years.

The civilian equivalent of a brigadier general, Dr. Bryson led the only test organization of its kind that included an armor-mechanized infantry task force dedicated to the test and experimentation mission. He was respected as "the Commander" of the unique soldier-scientist team of more than 1,000 military and civilians.

In August of 1991, Dr. Bryson relinquished his command and became the TEXCOM Technical Director. He was immediately effective as a leader, mentor, advisor, and scientist.

Until his retirement in 1994, the insights of this extraordinarily experienced test manager had significant impact on the efficiency of test design and data collection requirements. He was the acknowledged expert on test instrumentation projects in support of operational test activities.

The impact that Dr. Bryson has made on operational testing yesterday, today, and tomorrow is unparalleled.
